

Playwright with TypeScript

Week 5 – Home Assignment

Program	Playwright with TypeScript
Module	TypeScript Advanced Types
Week	Week 5
Assignment	Practice different types of Enum creation and accessing enum values in TypeScript

1. Objective

To understand and practice different types of enums in TypeScript and learn how to access enum values in various ways.

2. Problem Statement

Write a TypeScript program to create enums of different types and demonstrate how to access their values.

3. Requirements

1. Create a Numeric Enum for Days of the Week starting from 1.
2. Create a String Enum for Browser types.
3. Create a Heterogeneous Enum with both number and string values.
4. Create a Const Enum for Environments.
5. Access enum values using the following:
 - Enum name and member name (e.g., EnumName.Member)
 - Enum value by index (for numeric enum)
 - Loop through enum values
 - Use enum values in a variable and print the output
6. Add meaningful comments for each example.
7. Use console.log() to display the output.

4. Sample Test Data and Expected Output

Scenario	Expected Output
Numeric Enum (Days)	Days.Monday: 1 Days[1]: 'Monday' All days: Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday
String Enum (Browsers)	Browsers.Chrome: 'chrome' Browsers.Firefox: 'firefox' All browsers: chrome, firefox, edge
Heterogeneous Enum (Response)	Response.Success: 200 Response.Error: 'ERROR'
Const Enum (Environments)	Environments.QA: 'https://qa.testleaf.com' Environments.PROD: 'https://prod.testleaf.com'
Using Enum in Variable	Selected Day: Monday Selected Browser: chrome Current Environment: https://qa.testleaf.com'
Loop through Enum values	Days: Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday Browsers: chrome, firefox, edge

5. Technical Guidelines

- Use TypeScript (.ts file).
- Implement Numeric Enum, String Enum, Heterogeneous Enum and Const Enum.
- Access enum values using different methods (name, index, loop, variables).
- Use console.log() to display the output.
- Add comments to explain the code.
- Use meaningful enum names and values.

6. Learning Outcome

After completing this assignment, you should be able to:

- Create different types of enums in TypeScript.
- Access enum values in various ways.
- Understand the use cases of numeric, string, heterogeneous and const enums.
- Use enums in real-time style scenarios.
