

Playwright with TypeScript

Week 5 – Classroom Activity

Program	Playwright with TypeScript
Module	TypeScript Basics
Week	Week 5
Activity	Create and Use Object Literal in TypeScript (Using . Notation Only)
Duration	30 – 45 Minutes

1. Objective

To practice creating object literals in TypeScript and perform basic operations using dot notation (.).

2. Problem Statement

Write a TypeScript program to create an object literal to store information about an employee and perform various operations on it **using only dot notation** to access and modify the properties.

3. Requirements

1. Create an object literal with the following properties: empId, empName, department, isActive, and salary.
2. Print all the property values using dot notation (.).
3. Update the salary value and isActive status using dot notation.
4. Add a new property called location using dot notation.
5. Delete the department property from the object using dot notation.
6. Print the final object after all the operations.
7. Use meaningful variable names and appropriate TypeScript types for the object properties.

4. Sample Test Data and Expected Output

Operation	Expected Output
Object Creation	{ empId: 101, empName: 'Vineeth', department: 'QA', isActive: true, salary: 60000 }
Access properties using . notation	empId: 101 empName: Vineeth department: QA isActive: true salary: 60000
Update salary and isActive	salary: 75000 isActive: false
Add new property	location: Chennai
Delete property	department property removed
Final Object	{ empId: 101, empName: 'Vineeth', isActive: false, salary: 75000, location: 'Chennai' }

5. Technical Guidelines

- Use TypeScript.
- Create an object literal with appropriate property types.
- Use only dot notation (.) to access, update, add, and delete properties.
- Use console.log() to display the output.
- Do not use bracket notation ([]).
- Use meaningful variable names and proper formatting.

6. Learning Outcome

After completing this activity, you should be able to:

- Create an object literal in TypeScript.
- Access object properties using dot notation.
- Update, add, and delete object properties using dot notation.
- Work with real-time style data using object literals.
